TARGET AUDIENCE: BDS GRADUATES
(CLASS OF 2021 - 2024)

Periodontitis is one of the leading causes of tooth loss. However, what types of cases truly require specialist management? For patients who have already lost teeth, how do we assess their suitability for implant placement? This talk aims to provide young clinicians with a framework in assessing patients' need for referral for specialist periodontal management and to guide them on appropriate case selection for simple implant therapy.

Learning objectives:

- Understand the scope of periodontitis that can be managed in primary care
- Learn how to carry out basic screening and identify suitable manageable implant cases
- Understand and appropriately refer cases to institution

PARTICIPANTS WILL RECEIVE TWO CPE POINTS AND A BENTO PACK AT THE SESSION.

Centre for Advanced Dental Education
Faculty of Dentistry
